

## ByrdOpti

### ***Recommended Process Lasso Settings (Rust / Gaming)***

***Process Lasso is used to automatically manage CPU priorities, CPU affinities, and background process behavior. It does not directly increase GPU performance, but it can help maintain smoother frame times by keeping unnecessary background tasks from interfering with games.***

Recommended Rust Profile:

Process Priority Class:

High

CPU Priority:

High

CPU Affinity:

Leave Default (Recommended)

CPU Sets:

Leave Default unless troubleshooting stutters

I/O Priority:

High

Memory Priority:

Normal

Application Power Profile:

Bitsum Highest Performance

Induce Performance Mode:

Enabled

ProBalance:

Enabled

Gaming Mode:

Enabled

Rust Specific Rules:

Create a persistent rule for:

RustClient.exe

Set:

Priority Class:

High

I/O Priority:

High

Application Power Profile:

Bitsum Highest Performance

Background Process Management:

Enable:

- ProBalance

Recommended ProBalance exclusions:

- RustClient.exe
- Steam.exe
- Discord.exe (optional)
- NVIDIA Container processes (optional)

Avoid setting everything to High priority:

- Too many high-priority processes can hurt performance by starving Windows tasks.
- Only prioritize the game and important gaming apps.

CPU Affinity:

Recommended:

Default / All cores

Do NOT disable cores unless testing.

Older guides often recommend disabling SMT/Hyper-Threading cores, but modern CPUs and Windows schedulers usually handle this better automatically.

Performance Mode:

Enable "Induce Performance Mode" when Rust launches.

This temporarily:

- Uses the Bitsum Highest Performance power plan
- Prevents aggressive CPU power saving
- Keeps CPU clocks more consistent

Optional Advanced Settings:

Disable IdleSaver:

Only if playing plugged in on a laptop or desktop.

Use Performance Mode while gaming:

ON

Automatically close unnecessary launchers:

Optional

Rust Notes:

- Rust is CPU-heavy and benefits more from stable CPU scheduling than raw priority changes.
- Large FPS gains usually come from graphics settings, drivers, RAM speed, CPU performance, and reducing background load.
- Process Lasso is mainly a consistency/frame-time tool.

Recommended Competitive Rust Profile:

- ✓ RustClient.exe Priority: High
- ✓ RustClient.exe I/O Priority: High

- ✓ Bitsum Highest Performance: Enabled
- ✓ Gaming Mode: Enabled
- ✓ ProBalance: Enabled
- ✓ CPU Affinity: Default
- ✓ Avoid disabling cores
- ✓ Avoid forcing every process to High
